

I took digital photography in the last semester. This is my project in the photography class. I chose my own adventure. I chose the topic of water, and I will tell a story about water pollution. I went down to the creek and took images of the water pollution. I used a variety of compositions for these images I shot, and for some I used low angle wide angle shots so that I could really show the water pollution. When I decided to shoot the subject of water pollution, I thought of the garbage that would appear in my images. The presence of trash will make the image more realistic, and with the color image, this will make the image more impactful. I suggest not to throw trash into the water, but to throw the trash to the right place as well as to do the separation of trash, recyclable and non-recyclable, and not to throw away used batteries so as not to cause heavy metal pollution in water bodies, etc.
